
RouteGuard

Supply-chain disruption assistant & fleet utilisation optimiser.

BOBATHON 2026 // AI TRACK

A control tower that turns network noise into the next safe move. Powered by IBM Bob and watsonx.ai.

The network changes faster than teams can correlate.

SIGNAL OVERLOAD

Cascading disruptions

Weather, port strikes, and geopolitical events hit hundreds of shipments at once. Manual triage closes the intervention window before a move is made.

ASSET IMBALANCE

Idle fleet capacity

Trucks and containers sit idle in Lyon while Rotterdam lanes are overloaded. Operators lack the cross-system visibility to match capacity to risk.

COLD-CHAIN RISK

Silent cargo spoilage

A single temperature excursion can spoil a \$500K+ cargo. Breaches are often discovered at delivery—too late for regulatory recovery or re-routing.

One decision surface for four operational questions.

QUESTION 01

Which shipments are affected?

RANKED PRIORITY QUEUE

QUESTION 02

What is the viable alternative?

CARRIER & ROUTE RECOMMENDATIONS

QUESTION 03

Where is the idle capacity?

FLEET REDEPLOYMENT MATCHING

QUESTION 04

Is the cargo still recoverable?

COLD-CHAIN SEVERITY CLASSIFICATION

From signal to operator-approved action.

**GUARDRAIL :**

Bob provides the explainable rationale and ranked next moves, but RouteGuard never executes a carrier change or asset redeployment without an explicit operator sign-off.

What the operator sees.

Reproducible demo with seeded operational data and LLM fallback.

LIVE PREVIEW: ROUTEBOARD COMPUTER

IBM Bob is load-bearing.

INTEGRATION BOUNDARY

```
// server/routers.ts
assistant.ask({ query, context }) {
  return invokeLLM({
    model: "granite-3.0",
    prompt: decision_brief,
    context: operational_data
  });
}
```

The server-side integration keeps watsonx.ai credentials secure while providing Bob with a bounded, current operational context.

1 Governed reasoning

Bob correlates disruption, fleet, and sensor signals using watsonx.ai / Granite to produce explainable recommendations.

2 Zero-trust credentials

Model keys and carrier tokens never leave the server. The browser only sees the operator-facing recommendation.

3 Explainable next moves

Every Bob response includes the priority, the evidence rationale, and the required operator approval step.

Start with a demo.

Scale into a control plane.

32%

MTTR Reduction

Automated correlation and Bob-led prioritisation cut the time between disruption detection and operational response.

18%

Utilisation Gain

Utilisation Gain

Matching idle fleet assets to at-risk shipments reduces empty miles and increases network optionality.

\$0.00

Spoilage Target

Real-time cold-chain classification enables intervention before a temperature excursion becomes a total cargo loss.
